Subject: Request for Dive Team support at San Jacinto
Date: Wednesday, September 06, 2017 11:57:33 AM

Monica,

I am requesting resources to support a dive team effort at the San Jacinto site. The responsible party is currently beginning the inspection protocol established for the site to measure any changes to the armor rock cover system. This effort by the dive team would include:

1. Immediate presence by a dive team member to oversee the survey and probing effort being conducted by the responsible party. This is expected to be a 2-3 day effort.
2. Concurrent with the inspection, evaluate the data to determine any anomalies in the cover system. This could be debris or foreign objects, absence or scour of the cover system, detection of underlying waste materials.
3. Develop in consultation with the EPA RPM, a plan to further characterize the anomalies. The scope of this characterization could include additional probing, shallow water observation without diver submersion, and finally diver submersion to inspect the anomaly. The scope of this effort is dependent on the inspection.
